

As a former ARRL director I firmly support RM-10352 which segmentizes the 160 meter band by operating mode. As an operator on 160 meters I fully appreciate the annoying interference made by both AM and SSB phone operators below 1843 KHz when using CW. But the phone operators also will benefit by RM-10352. This change is long overdue, benefits all, and has minimal cost impact.
